Dominators

Dominators understand that this is a common trait in Probationers and that most will eventually grow past it, discipline and efficiency are still the order of the day and more than one truculent Probationer has pushed too far and ended up left behind on a planet to add his own mass to the fuel supply

A Fast Algorithm for Finding Dominators in a Flowgraph

The fast dominators algorithm consists of three parts First, we perform a depth- first search on the input flowgraph $G = (V, E, r)$, starting from vertex r , and numbering the vertices of G from 1 to n in the order they are reached during the search The search generates a spanning tree T rooted at r , with vertices

A Simple, Fast Dominance Algorithm

Dominators are then found by successively removing each node from the graph and noting which children of that tree node can no longer be reached in the graph This algorithm again requires quadratic time to complete [24] In 1974, Tarjan proposed an algorithm that uses depth-first search and union-find to achieve an asymptotic
